

Phase 9.23 Design Notes

Autonomous Enterprise Omni-Intelligence Fabric

Project reference document. Product capabilities must be verified through code review, testing, security assessment and deployment evidence before production claims are made.

1. Phase objective

Unify intelligence across enterprise channels and domains through assessment, fusion, reasoning, synchronization, context, orchestration, trust and outcome optimization.

2. Implemented pattern

- Spring Boot controller, service, entity, repository, specification, DTOs, enums and exception handling.
- React/TypeScript page, API service and domain types.
- Generate, get, history, search, analytics, dashboard and health endpoints.
- Review, approve, reject and publish workflow.

3. Validation notes

- Backend requests were validated in the project workflow.
- Portfolio row values required explicit table-cell text color because global styling made values visible only during selection.
- The corrected CSS uses an explicit light text color for table data.

4. Reuse for later phases

Phase 9.23 provides the structural reference used for Phase 9.24, including package layout, endpoint style, scoring, workflow and UI composition.
