

Phase 9.24 Design Notes

Autonomous Enterprise Universal Knowledge Fabric

Project reference document. Product capabilities must be verified through code review, testing, security assessment and deployment evidence before production claims are made.

1. Phase objective

Provide a shared, governed knowledge layer across NexusOne AI. The module captures knowledge graph strategy, cross-fabric linking, organizational memory, semantic discovery, governance, quality, reuse and learning.

2. Backend design

- Base API: /api/autonomous-enterprise-universal-knowledge
- Entity table: autonomous_enterprise_universal_knowledge
- Narrative fields stored as LONGTEXT.
- Eight component scores contribute equally to the universal knowledge score.
- Lifecycle: GENERATED -> REVIEWED -> APPROVED -> PUBLISHED; GENERATED or REVIEWED may be REJECTED.

3. Frontend design

- Dashboard cards for totals, lifecycle counts and knowledge score.
- Knowledge briefing form with narrative fields and score inputs.
- Overview metrics and a lifecycle-enabled portfolio table.
- Module-scoped CSS with explicit table-cell text color.

4. Integration points

- Add the new tab literal to src/types/nexus.ts.
- Import the page in src/layout/NexusOne.tsx.
- Add a navigation item and renderPage switch case.
- Use the API request file supplied with the Phase 9.24 package for validation.

5. Future evolution

Later phases can build on published knowledge records for memory, simulation and governed decision support. Before production use, define provenance, ownership, access control, retention, versioning and relationship storage appropriate to the selected knowledge technology.
